

Data scraping in .json

We want to scrap as much data as possible from the following website www.gutekueche.at
The website language is **German** we need to be translated it into **Romanian**.

We can start with on single recipe to check the flow and the result.

All the recipes should be imported into a WordPress page where we use **WP Recipe Maker**
<https://help.bootstrapped.ventures/article/197-import-recipes-from-json>

An example export of the: [Amazing Vegetable Pizza recipe](#)

It can be found here: <https://demo.wprecipemaker.com/wprm-recipe-export.json>

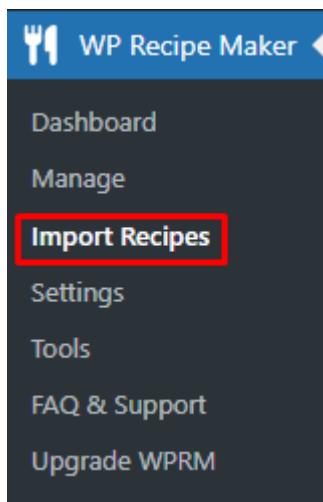

*If you need, we can give you a premium OpenAi secret key.

I created a demo site to test the process and the result.

Sandbox Site: <https://gergos4.sg-host.com/wp-admin>

User: Nghi

Password: xgLzx*qoUt(E1P@XX1RR#nYs

*****Right now, we use the free plugin, which does not support .json importing. If you accept this job, we will buy the premium version.***
